To whom it may concern,

I am pleased to recommend Timothée MEYER, whom I had the opportunity to work closely with during his five-month training period at Forvia Interiors – Méru, from September 1st, 2025, to February 7th, 2026.

As Global Innovation Domain Manager for the Instrument Panel (IP) at Forvia Interiors, I had the opportunity to involve Timothée with his mentor Prashant KUMAR in advanced innovation activities within our IP Lean Airflow Architecture program. During this period, he demonstrated strong technical capability, creativity, and a remarkable level of autonomy for a student in Mechanical Engineering and Product Design.

Timothée contributed significantly to several technically demanding topics, including:

The robust parametric design of test environments in CATIA, enabling rapid CFD iterations across multiple air-vent configurations.

The adaptation and optimization of complex duct geometries for CFD simulations.

Ideation phases and iterative development of innovative “invisible air vent” concepts within the instrument panel architecture.

Beyond his technical skills, Timothée showed strong analytical thinking and a structured engineering mindset. He was able to quickly understand architectural constraints related to airflow performance, packaging, and integration within the instrument panel environment. His ability to bridge design intent with engineering feasibility was particularly valuable.

He also contributed to our innovation reflections and early-stage concept exploration, demonstrating curiosity, initiative, and a genuine interest in long-term innovation strategy.

Timothée combines creativity with rigor — a rare and valuable combination in product innovation. I am confident that his planned academic experience at UTSEUS in Shanghai, focusing on innovation and entrepreneurship, will further strengthen his international exposure and strategic thinking capabilities.

I strongly support his application for advanced training or a first professional opportunity in the field of innovation and product design. I am convinced he will bring value, energy, and technical depth to any organization.

Please feel free to contact me should you require further information.

Best regards,
